Were there different or distinct versions of the 550. If so is there a way to ID the one we have. It is called the 550B, was there an A or base model. The press is in a lot of parts. The powder measure doesnt seem the same as the one in the manual either. Also, have all 550s came with an auto primer. He doesnt think this one has one. Ive got it all in front of me and am trying to match things up and take an inventory; It is quite the project. I have reloading experience, but not with any Dillions. I could use an older manual for Dillon dies too. It lacked the low primer alarm, the mechanical failsafe return rod and bracket for the powder measure. <http://www.pbpkrosno.com/fck/ca-endavor-user-manual-pdf.xml>

- **dillon precision rl550b manual, dillon precision rl550b manual, dillon precision rl550 manual, dillon precision rl550b manual pdf, dillon precision rl550b manual download, dillon precision rl550b manual free, dillon precision rl550b manual online, dillon precision rl550 manual.**

The older powder measure has a different design to the bellcrank the stamped steel arm that pushes the powder bar over, and uses a spring or two to retract the powder bar. All RL 550s included the automatic primer feed. If necessary, please take some photos of what is there and email them to us, for better identification of what is missing. Is this something I need to upgrade for safety reasons. I need to clean and lube it also, the original owner used cast bullets and there is bits of old hard lube around. I think it needs to be taken apart. Ive looked at the video some. Is this able to use current parts if I find something missing. All of the primer parts are there, except the alarm, which you said wasnt included in the older model. I think thats what threw us off. All current parts fit the older versions of the machine, no worries there. If you email us please include your address. Call us at 8007623845 and get a new one OR just check these out. Mr. Bulletfeeder has been around for some years now, and has gained a huge following worldwide. The patented system is by far the best performing personal use bullet feeder on the market, and has been, since its introduction in 2006. DoubleAlpha Academy has teamed up with RAK Systems, the original designer and patent holder of the system, to redesign and streamline the product, making it more compact, more versatile, better looking and more affordable than ever before. Dillon Precision Instruction Manuals Manuals for Dillon Precision Reloading machines. The Dillon BL 550 is the basic version of the RL 550B reloading machine. Instead of having the automatic powder measure and priming systems included with the RL 550B, the BL 550 offers a funnel system so weighed powder charges may be poured into

the case without removing it from the shellplate. Primers are set into the primer seating arm by hand. The BL 550 will accommodate the widest variety of cartridges, from 32 ACP up through 338 Lapua, 416 Rigby and 460 Weatherby. <http://everestart.com/images/stories/ca-dot-traffic-manual.xml>

Get your new reloader setup quickly, and easily, with this EZ Start Guide. Step by step setup instructions along with helpful illustrations make getting started reloading easier than ever before. Creators are allowed to post content they produce to the platform, so long as they comply with our policies. United Kingdom. Company number 10637289. But, below are my reviews, comparisons, and detailed info for Dillon Precision's Square Deal B, RL 550B, XL 650, and the Super 1050 B, from when I was a Dillon dealer. Reloading Access. If you've done the research, you know where I'm coming from. Consider the quality and innovation behind each product, the lifetime "No BS" warranty, and the unparalleled reputation for postsale service, and there simply isn't any other option. Your only decision is which machine to buy. From the "pistol only" Square Deal, the "workhorse" RL 550B, the fully progressive XL 650, to the commercial grade Super 1050. They even offer a progressive shotshell loader that blows away everything on the market. Your final decision will depend on how many rounds and how many calibers you will shoot monthly, and money spent vs. Reloading Access. Reloading Access. If you only plan to load pistol ammo, don't have much cash to spend, and don't need to crank out huge volumes in the shortest time possible, the Square Deal may be for you. For some, its compact size makes it more difficult to operate and maintain than Dillon's other machines.

It cannot load any rifle cartridges! Powder Die but not Powder Measure Reloading Access. And it's as easy to learn to reload on as a single stage! It's a rugged, durable machine that will virtually produce ammo forever. The truth is Without a Casefeeder, autoindexing only unnecessarily complicates the machine, without offering any increase in speed. Because, while your right hand cycles the handle, your left hand grabs a bullet, then waits for the shellplate to return. After seating the primer, while your right hand is reaching for a new piece of brass, your left hand indexes the shellplate and sets the bullet on the case which is charged with powder before your right hand can insert a new case in the Shellplate. I almost always recommend the 550 for your first progressive reloading machine. Often, instead of a Caliber Conversion, you may only need to buy a Powder Funnel if both Caliber Conversions use the same Shellplate and Locator Buttons. Reloading Access. First, it is a little more difficult to clear a stoppage than it is on the 1050. The 8station shell plate on the 1050 leaves you plenty of room to work; opposed to the 5station, 650. Second, you seat the primer manually, by feel, at the end of the upstroke, like most every other press in the world. Reloading Access. In addition, the increased stroke now accommodates rifle calibers while the handle stroke is kept to a minimum, meaning less work for the operator. In fact, the only options to consider are the Powder Check system and the Bullet Tray; the latter replacing the plastic bullet tray standard with the machine. You'll find the primer pocket swager invaluable, even if only a single piece of military brass sneaks through your machine. In fact, the priming swaging station, in addition to seating the primer on the downstroke, are the two main advantages of the machine over the XL 650. Of course, I've loaded a few bazillion rounds over the years, so that helps.

The 1050, however, only comes with one priming system and one powder bar, for whichever caliber you order. So, if caliber changes will be involved, lean toward the 650. One usually knows when

they're ready for the 1050. If you're not sure, get the 650. If you can afford it and don't plan to switch calibers, get the 1050. You'll smile every time you sit down to load. Would this stop me from buying a 1050. Absolutely not. The beauty of seating the primer on the downstroke only on the 1050 has to be experienced to be fully appreciated. The RL 550B is the workhorse of the line, capable of loading any pistol or rifle caliber quickly, accurately, and with very little maintenance. The XL 650 is designed for the serious "Single Caliber Volume Shooter," who can't afford Super 1050B. It's a common practice for competition shooters to buy a 650 or 1050 in the "volume caliber," and then use a 550 to load additional calibers. The 1050 is truly the ultimate in fully progressive machines — once you've loaded on one you'll understand. In general, the more moving parts, the longer the learning curve. If your bench is not bolted to the wall or floor, or isn't heavily constructed, definitely order the strong mount and bullet tray when you order the press. It increases the "footprint" to over ten inches, spreading the load over the bench instead of stressing the leading edge. The Strong Mount improves every operation on every machine, especially the automatic powder dispensing and priming systems on all machines, and the Casefeeder and auto indexing operation on the 650. In fact I'd almost recommend buying the Strong Mount just so you could add the Bullet Tray. Probably its most valuable contribution is the confidence it inspires. It mounts in the 650 or 1050's extra Toolhead station the 550 does not have an "extra Toolhead station" and checks for gross powder errors before seating the bullet.

It eliminates the fear of a cartridge loaded without powder, or worse, the dreaded double charge. Even with the Powder Check System, however, there is no substitute for paying attention to what you are doing and what is happening while you are reloading ammunition. Comments from a forum member on that topic. Then either a case without powder or a double charge is readily apparent. Some folks love and really should have this item, others could care less. I've never used it; nevertheless, in a moment of inattention I have let the measure run dry once or twice while cranking away on a 1050. It's a big loser if you run dry, especially if your loaded ammo hopper is full of ammo WITH powder. But if you're buying your first reloading press, after watching the DVD, you'll be reloading with confidence in no time. Reloading Access. Shellplate, Locator buttons, Powder Funnel. Although not too big of a deal, it does require quite a bit of time to recalibrate the Powder Measure every time you change calibers. Especially if you don't have an electronic scale. Then you could leave one Powder Measure set up with the Small Pistol charge bar and the other Powder Measure set up with the Large Rifle charge bar. In other words, you'd have a dedicated Powder Measure for both pistol and rifle. And since you will typically always leave one Toolhead Assembly in the machine, you do not need to purchase any additional Toolhead Stands. Or in other words, you only need additional Toolhead Stands or Toolheads or Deluxe QuickChange Kits for each additional Caliber Conversion. Then, since you won't need to change anything on the bottom end, and, you can leave the entire Toolhead including the Powder Measure, adjusted to throw the each respective calibers powder charge, you could change calibers in about 15 seconds. Before you readjust the Seat, Crimp, and Powder Dies to load 357, mark each Die body with a blue Sharpie marker, and also make a corresponding mark on the Toolhead.

Now with those reference marks for each caliber, you can quickly readjust the three Dies to change back and forth between the two calibers. If you add a caliber to the press in the opposite size primer, and decide you also want to buy the Priming Quickchange, then only 1 Priming Quickchange is required. Example You order the 650 press in 9mm small primer, then add everything required to also load 45 ACP large primer. And you want to be able to switch back and forth between primer sizes as quickly as possible. So you would buy the Priming Quickchange in Large Primer. Reloading Access. The radius opening on all three dies is critical for performance on a progressive machine, especially for the sizing die, and the quickdisassembling, easily adjustable seating dies are a thing of beauty compared to the traditional offering. And roll the case around and take an average of measurements from several different positions. You want the measurement to be the bullet diameter

plus two case wall thicknesses. Because in a Dillon press, the flaring operation is done in the powder dispensing station with Dillon's "Powder Funnel". So I do not recommend Dillon Dies for use in "Single Stage" presses. Anything you can do to strengthen your bench, or the connection between your bench and the machine, is a good thing, especially for the 650. Especially as you're coming close to your target charge weight. Clear all the empty cases out of the Shellplate, and remove the Locator Buttons from the powder dropping station and the bullet seating stations. Put an empty, primed case in the powder dropping station. Cycle the handle so it drops one charge in the case. Remove the case, place it back in the powder dropping station and cycle the handle again. Remove the case and dump the two charges of powder in the scale's pan. Repeat that procedure. Now you have four charges in the pan. I don't sell it but you should be able to find it at your local gun shop.

Basically, you just dust a light layer over the cleaned cases and forget about it. You don't even need to tumble or clean it off. The CV2000 series Case Cleaner and Media Separator are monster's, well suited for cleaning lots of brass. If you have plenty of room and are into mass production, get the big boys. Otherwise, I always recommend the 750 Tumbler and the 500 Media Separator for your first purchase. The 750 tumbler and 500 separator are perfect for most everyone but the "highvolume" shooter. You simply push the tube's tip down over each primer until all the primers are up in the Pickup Tube. With a little practice you'll suck up a 100 primers in no time. It requires its own, specially designed, shielded tube. You will also use a caliper to measure the taper crimp adjustment for semiautomatic pistol cartridges. A handy, inexpensive representation of the internal dimensions of your caliber's chamber machined to SAAMI specs, they provide a convenient way to quality control check loaded ammo. Either one of those errors will cause the cartridge to not chamber in your pistol. That's what Calipers are for. And Calipers will not tell you if a round will not chamber in your pistol or revolver because the base of the case was not resized enough. But the Case Gage quickly will. But who wants to disassemble their pistol just to chambercheck ammo as it's coming out of the press. Of course that's not nearly as difficult with a revolver, unless it's locked in a safe. If you've taken good care of your machine, expect to recover at least 80-90% of its original cost, if you decide to upgrade. Their customer support is truly outstanding. Reloading Access.
