Dimplex Cxl24N User Manual

Dimplex storage heaters are simple to assemble for flexible positioning and quick installation using secure wall fixings for safety. Manual Dimplex slimline storage heaters have manual input controls adjustable to control the amount of heat stored during the charge period. Slimline automatic Dimplex storage heaters have a charge regulator, automatically adjusts level of input charge when weather conditions change. Room temperature boost control increases heat output in the day by allowing more airflow through the heater core. XLS range is constructed to minimise user intervention. The convector heater gives instant silent top up heating. It can operate independently of the storage heater. A convector thermostat can be set to maintain room temperature and automatically switch on when needed. Convector controls are conveniently displayed on the front panel. For additional heat boost there is a fan assisted output element. FXL fan storage heaters require little top up from day time electricity, resulting in low annual running cost. Automatic charging result in excellent economy for all electricity tariffs. For commercial environments there is high speed fan for fast heat discharge. Room temperature is calculated using accurate thermostatic controls. Also suitable to supplement an existing heating system with additional background heat. A thermostatically controlled quiet fan provides high heat retention and accurate output. The fan provides rapid room temperature lift and controlled heat discharge. To ensure air output temperature consistency, hot air from the core is automatically mixed with room temperature air. For maximum accuracy the thermostat has its sensor at the base of the storage heater next to the air inlet fan. The thermostat also accurately controls temperatures in large commercial environments where there are localised hot or cold areas. Below are concise Instructions how to repair broken storage heaters from Dimplex service engineers. Is it worth repairing or should i buy a new one Dimplex suggest if you are a competent user comfortable taking off the front panel you may check to see if the thermostat is the cause of the problem see below to see if it can be fixed. Beyond this, only qualified electricians or engineers should attempt storage heater repairs. Thermostat and elements have been known to require replacing every couple of years. You will know when an element fails because a section of the heater will turn cold. Provided it hasnt been accidentally covered by clothing or similar. If you are a competent enough user to go inside and take off the front panel, there are two screws at bottom of the heater, unscrew these and carefully remove the front panel. The Thermostat looks like a little black cap nubbin with a red dot push it down to reset thermostat, if you hear a distinct click it should work on next charge period overnight, if not, the thermostat could be faulty and need replacing. Put front panel back on, turn power on and wait until your next off peak charge overnight to see if it takes next charge. If not, call a service engineer for a quote to see the cost of a call out and storage heater repair, or see if its worth removing and buying a new replacement storage heater. Storage heaters have a long life typically although an element or thermostat may fail after 6 or 8 years. Before replacing a broken storage heater check that there isnt a fault with the wiring, switch or circuit breakers with help from an engineer or competent user. Measure resistance to check for failed elements. If I am not sure about a broken heater, installation

or fixing spare parts. Dimplex customer service Tel 0845 600 5111.

I understand that they only come on overnight as they are connected to a different circuit but do they stay on full the full 7 hours of economy 7 or do they turn off when they are fully charged. I am trying to estimate how much it is going to cost me to use them. Does anyone else have Dimplex storage heaters and knows for example how many hours are needed to reach full charge, medium or low charge. Any help is greatly appreciated. If the last two are the case, does anyone know roughly how many kwh i am looking at. Hope that all makes sense. There is a thermostat inside the heater which shuts off when the bricks reach a certain temperature and will maintain that temp during the off peak time. As for the cost I dont know that one. Obviously if set to lower input it will use less than

23.8kWh. Obviously if set to lower input it will use less than 23.8kWh. A heater will not expel all its heater during the day. If set at maximum, the thermostat will cut off when the heat reached is that set by the manufacturer for that particular heater. Once heated from cold, it will not consume electricity for anywhere near 7 hours. This is confirmed by hearing the thermostat clicking on and off. A heater will not expel all its heater during the day. I don't think they have ever been on maximum. The boost is on automatic, so retains heat better than our previous manual ones. I keep a careful check on our electricity consumption and figures show a summer overnight consumption immersion heater, washing machine, dishwasher, etc but obviously no storage heater use of 10 units. Looking back at my records the highest winter overnight consumption has been 67 units, so storage heater use has been around 57 units in the coldest weather. This would mean that storage heaters totalling 15.35 kw use 57 units ie around 4 units per kw of heater per night. To get your own figures you would just have to take a reading each day. I don't think they have ever been on maximum.

To get your own figures you would just have to take a reading each day. So on a setting below maximum you use just over 50% of the theoretical maximum. I don't think they have ever been on maximum. To get your own figures you would just have to take a reading each day. Be Happy, would you say that the input on your storage heaters is always above or below the half way point. Does any one else out there have any figures that they are willing to contribute. So on a setting below maximum you use just over 50% of the theoretical maximum. Position of storage heater doesn't help either, it is at opposite end of sitting room from seating area. I've taken readings while using the electric fire, and it seems to have a very good thermostat, so power consumption is not too bad on the 1kw setting it seems to use around 2kw for 3 hours in winter. Dimplex once provided an online list for all their heaters and thermostats, but no longer have the product manuals available on their website for customer download. They make both 120VAC and 240VAC versions and several different models, so I can't safely provide you with the wiring connections, since each installation is different and depends on the type of thermostat and heaters being utilized. So now that I've given you the bad news, let's move onto the good news! Dimplex now uses an online request form for customers to get manual and literature on all their products.
