### Book Descriptions:

We have made it easy for you to find a PDF Ebooks without any digging. And by having access to our ebooks online or by storing it on your computer, you have convenient answers with Dometic Classic Rm2620 Manual . To get started finding Dometic Classic Rm2620 Manual , you are right to find our website which has a comprehensive collection of manuals listed.

Our library is the biggest of these that have literally hundreds of thousands of different products represented.

## Book Descriptions:

# Dometic Classic Rm2620 Manual

There are several components that work together to get the refrigerator to cool properly. Understanding the basics will help you in locating the cause of the failure. You will know that you have one of these models if the refrigerator has a compressor in the back typically installed in boats and trucks. Most RVs have gas absorption refrigerators and these can be more troublesome since there are more components that affect the cooling. Below is a useful diagram of the gas absorption cooling unit on your Dometic refrigerator. The first thing to know is that the cooling units on every Dometic gas absorption refrigerator are gravity operated and MUST be level in order to run properly. The second thing you need to understand is that the refrigerator will not cool properly if it is too hot outside typically over 90 degrees F ambient. If you remove your refrigerators access panel on the outside of the RV you should be able to look up and see these fins. Make sure that there are no obstructions. If your refrigerator doesn't have good air flow it will not cool properly. Many models do not come with external fans behind the cooling unit. For the RVers that love the heat, we recommend installing some fans in the back to help with the air flow. It has a 4prong connector located at your light fixture at one end and the other end connects inside the refrigerator on one of the back fins. To test this Thermistor you don't need any tools whatsoever. Provided your refrigerator is not showing any fault codes, you can turn the temperature setting as cold as it gets and disconnect this Thermistor. If it cools properly, you have a bad Thermistor. The freezer does a good job of freezing ice and keeping it frozen but the refrigerator is not much below ambient. Gas or electric does not seem to make any difference. The chimney is good and hot to the touch. Any thoughts on why one part would work OK and one would not Even a slight decrease in flame size can have a detrimental affect on cooling performance. It covers the items Brett mentioned and has contact information. I did not find any reference to the sensor, but know there is one in the repair list of parts.

I've been tied up with family matters but will start doing the tests prescribed by Brett and in the manual when I finally arrive home and have some time. As of this moment the refrigerator seems to be cooling properly and the temp in the refrigerator compartment this morning was 34, which is where it has been until this recent glitch. We have been in very hot weather the last month and have felt the refrigerator has not been cooling the way it should. Unfortunately I have not been able to find any performance specs as to what temps should be and at what ambient temps. The specs on the Dometic website do not provide that or I was looking in the wrong spot. Can anyone provide that. My model is a NDR 1292 Mine is a RM3862 in a 2000 Dutch Star. Mine first acted up about 3 weeks ago with the onset of hot weather. Temps above 100F. I put a fan on the outside vent as recommended by a local repair guy. Within 24 hours the temp was down from 63F to about 34F. Worked good for about two weeks. Last week temps went up again both outside the MH and inside the refrigerator. Local guy said to turn off for 24 hours to allow all the chemicals to reform. No luck after that. Freezers freezes good but no cooling in refrig area. He says they aren't worth the money. So now I am looking at replacing with a home type refrigerator. If you can try removing the vent cover up on the roof and check for obstructions, Since you did have a fan blowing try putting it back and check to see if you have air flow out the vent. Experienced the same problems. After replacing the control circuit board it is operating like new. Go figure. This is aggravated by all these types of fridges having a weak cooling system that takes a long time to overcome placing new, warm items inside, or being able to deal with being lightly loaded. It's the nature of the beast. This one also shuts down now and then, requiring an alert eye to prevent excessive warming up before restarting it.

I attributed it to high winds or bad luck. It improved a little when the winds died off at night. The problem got a little better in transit, and then worse again once I parked in the Cibola National Forest. Watching food spoil while parked miles from the nearest town is not the best. Repair is always possible, but the cost to disembowel an existing unit often exceeds the outright replacement cost. I looked at the options, just in case bad news came my way. This model, like nearly all RV fridges, runs on propane and 120VAC power when available. A few models run on 12VDC power too, but these models are all far too big and power hungry for the Innsbruck. Just one offers a 4 cubic foot frontopening model that would fit my application, but it costs twice as much as the propane Dometic I have. On the plus side, it can easily be plumbed into and powered by the house batteries

and solar system, and has no issues at all with tilt. Really level, in fact. Efficiency nosedives otherwise, and if the tilt is bad enough, they can be permanently damaged. The general guide is that if the camper is tilted enough to make walking uncomfortable or make you feel awkward, the fridge won't operate properly. I went out and looked at the OEM leveling gauges on the trailer, and saw that sidetoside tilt was somewhat off. So with considerable effort, I found several flattish rocks to put under the low side, and moved the trailer enough with the Ford to get the tires up on top of the rocks. Result better. Not perfect by the gauges, but the bathroom and cabinet doors no longer wanted to swing toward the low side. Okay. How much tilt is unacceptable. The manual doesn't say, and most of the values on the Internet give the tilt limits for the improved, newer units. I finally found the info for my fridge in a video 2 degrees fronttoback, and four degrees sidetoside relating to the trailer. That ain't much.

I don't have a leveling gauge that's calibrated to anything, so how would I know when I'm parked within these limits The readout is in tenths of a degree, and it can measure when set on its edge along a surface, or I can just lay the iPad on its back on the floor to get both readings at the same time. Sweet! I still need to position the trailer using the vague exterior gages, but then I can confirm exactly how she's sitting with the iPad, like 0.6 sidetoside and 1.7 frontto back today. It'll be quite a challenge to level the trailer within the specs, especially considering the kinds of places I park, but it'll just have to be done. I'm going to have to think about leveling it front to back or always placing a couple inches of lifts under the front tires when I park. Thanks for the info! The newer ones claim to be better, and are said to be listed in manuals. New ones can generally do 3 degrees FB and 6 degrees SS. If I were rich, I'd tear this Dometic out and go solar electric for tilt, accuracy, and reliability. As things are, I'll have to get serious and expand my collection of 2x4s to include some 2x6s for leveling purposes. Equipping a truck camper with a tiltsensitive fridge seems like kind of a contradiction of purposes, doesn't it I had a dead one in my furnace, and the local dealer checked it for free. I takes a moment, they just plug it into a proprietary tester that all authorized service places should have. If it's toast, it is probably a bad soldier joint on the board itself, the factory boards are crap. The solution is a Dinosaur brand board. They build a much cheaper, yet far more robust product to replace most delicate POS control boards on RVs. Second before you even think of dumping the fridge, check out "Amish cooling unit" on Google. Some Midwestern Amish outfit makes really high quality cooling units that are direct DIY replacements for the Dometic and Norcold parts. They are cheaper, tougher and well worth the trouble.

Just before I went out of range of email, I ordered a dinosaur board and it's waiting for me at my "home" mailing address. I will check out Midwestern Amish vendor, though. Thank you. Cancel reply Notify me of new posts via email. Im an active Evelo owner, and I personally endorse their ebike line. Should you purchase any model using the link below, Evelo will send me a referral fee at no additional cost to you. Undoubtedly the most useful source for finding shortterm RV parking. A very wellrounded, informative blog about fulltiming with way too many furbearin' critters in a big intergalactic cruiser. Would you leave your job to go birding across ALL of Latin America for 3 years. This couple did. A bicycling blog with numerous contributors, each exploring the fringes of sanity. A cinema blog featuring just about the most interesting and insightful views of various films. Far from your typical shallow action movie fansite. A wellwritten, informative and beautiful blog well worth returning to. A very entertaining site! This blog describes what it is like living with Asperger's Syndrome, and to focus on the positive aspects of the condition. As their description states, "We done dropped out," but not out of an insightful and amusing view of life on the road. The young lady, the dog, the motorcycle with sidecar, the road atlas, and the why. A retiree, his Sportsmobile Sprinter van, and his craving for the better class of tourist traps.
