The MultiPro 395 has a speed between 5,00035,000rpm, which is displayed on the label on the front. The MultiPro came with a comfort grip and was double insulated to eliminate the need for grounding. The MultiPro can also be identified by the blue caps on either side of the MultiPro as well as the blue variable speed switch. The MultiPro was later replaced by the Dremel 3000 a few years later and was retired by the Dremel company. Since then I cant even begin to remember the countless tasks its gotten me through. A few months ago it started to act up, The shaft would stop spinning for just a moment and then start again. It finally got worse to the point it just wasnt working anymore and I was looking at the 10 V lithium ion unit to replace it when I figured I might as well open it up and see whats going on. I immediately noticed the worn out clutch piece and I honestly wasnt surprised to find it right away on Amazon. These replacement pieces are manufactured by Bosch so I would expect there of the highest quality. I recommend this product.It has had use but not heavy use. Dremel tool works great now, whats not to loveI was right in the middle of a project when the motor tool stopped working motor kept running, but the tool did not. A quick perusal of the owners manual, which I had luckily saved in the box with the motor tool, showed a parts diagram which indicated the likely culprit, a failed drive coupling. Found these two replacement couplings on Amazon at a reasonable price and a fast delivery with Amazon Prime. Installed one of the couplings simple slipon installation, and was upandrunning again, and now I have a spare coupling for next time, if I need it my original coupling lasted a number of years.I took advantage of the multipack and stashed the spare in my Dremel tool case. Replacing the coupling is a piece of cake although it helps to have a third hand.

Check Youtube for instructional videos on how the job is done remove six screws, disassemble, install the new coupling, reassemble, put the six screws back into place. I never knew there was a plastic piece in the drive shaft. Couldn't find any parts at the 2 big box stores, so tried Amazon. Found these to be reasonably priced, so bought a 2 pack. Exact fit, and easy install. Very happy with the product. I almost ordered a new one right then, but I made do with a different tool. Then out of curiosity I took the tool apart and found the disintegrated coupling. After some online research, I discovered that failure of these is pretty common. I had no idea they were even used inside the tool. These replacements are a perfect fit, and now my tool is back in service. If it's another 20 years before another failure, I'll probably forget all over again. Oh, well. The 395 universal Bosch coupling I received didn't have a stepped down drive shaft end to fit my Moto Tool. I was able to increase its diameter by wrapping masking tape around the splines to mate with the tool's drive shaft end. This fix worked and the tool is functional again. However, I hope that there is a correct coupling available to fit the 395 type 3 Drexel Tool. At the time I had no tool to take out the screws that hold the body together. I finally found an inexpensive torx driver I think that's what it's called and disassembled the Dremel 395. The plastic drive coupling was broken I think I accidentally hit the spindle lock while it was running. This part from Bosch was perfect and was very easy to install. The reason for three stars on ease of installation was because I had to go find a tool to take it apart. The Dremel works like new again and I still prefer it over the cordless for most projects. A Well done to the people who still make the parts for what I thought was an obsolete tool and to Amazon for putting the whole deal together. I recommend buying the two pack for the economy, should it ever fail again.

I needed to do a bit of research to find the product is common for a number of tools, for example, for my Craftsman rotary tool. Be sure to check your tool for compatibility. I guess too much heat and speed wears down the plastic faster. The coupler had become brittle and cracked with age but the motor still purred like a kitten, voila. new part and a new Dremel! Thanks!
