## Book Descriptions:

# Dremel Repair Manual

Currently under contract designing environmental monitoring equipment. I figured that since it didn't smell of burning metal I should be able to get it going again. Add Tip Ask Question Comment Download Step 1 Assess the Mess. I did notice that it was running hot for the past little while. First unplug the tool. Check to see if the shaft spins freely, if not you may have a bearing problem. You can sometimes free up a bad bearing with light oil but noisy bearings mean mechanical damage and it should be replaced as soon as possible. If the bearings are bad then the whole armature will need to be replaced. If it does then next check the brushes. These are under small blue screw caps on my tool. On my tool one came out easily while the other separated from the spring and remained in the brush holder. So it looks like I have a stuck brush which has worn down and no longer makes contact with the commutator more later. This explains the no power situation. Add Tip Ask Question Comment Download Step 2 Disassembly Remove the hanging clip Remove the body screws, mine were torx 15 Gently separate the body halves making sure that no small parts fall out, like the shaft lock assembly at the nose of the tool. Remove the motor assembly from the body making sure to note which side is up with respect to your disassembly order. Remove the rubber spacer at the rear of the motor shaft Gently pull the brush block assembly rearward to remove it. Add Tip Ask Question Comment Download Step 3 Repairs Use a rounded tool like a screwdriver shaft and gently push the stuck brush out of the brush block. Check for damage, in this case there was none and I was able to reuse the brushes and brush block. Gently dress any warped or melted plastic with a needle file or sand paper. Reattach the spring to the brush using mild force. Test for proper fit by inserting the brush to make sure that it doesn't bind. <http://p-energo.ru/content/counter-ambush-manual.xml>

I suspect that the heat was caused by a dirty and worn commutator where the brushes contact the rotor, which in turn caused the brush to melt into the carrier. Using a very fine sand paper 800 grit clean and dress the commutator until it is shiny and smooth. Clean the black lines between the segments of the commutator using a brass brush to remove any chance of shorting. Add Tip Ask Question Comment Download Step 4 Reassembly Notes The brushes go in last. Severely worn brushes should be replaced. The brush holder connects to the motor assembly via friction fit contacts. Gently press them into place. Reattach the rubber spacer to the rear bearing and place the motor into the housing. Place the other half of the housing in place and test that the motor freely spins, if it grinds, open the case and flip the magnet assembly of the motor over and reinstall, it should be smooth now. Screw the case shut. Look for a dark line on one edge of the brushes, if there is one, then this installs in the direction of the arrow. Dark line in the direction of travel. Install the brush caps. Plug in the tool and test. If it doesn't spin at this point then you most likely have a burned out switch, unfortunately that will need to be replaced. Mine now works better than it has in a very long time. Now back to the original project. Add Tip Ask Question Comment Download Participated in the Hand Tools Only Contest View Contest Participated in the Teach It. Contest Sponsored by Dremel View Contest Share it with us! I Made It! Recommendations Fermentation Quilt The manual says that on slow mode it spins 15,000 rpm but it doesn't seem to happen. Can anyone tell me what happened and how to fix it Slow mode does not seem like 15,000. Did you resolve this. Should I just take it back and upgrade to the 3000 series variable speed 0 dsaav Ive had the same Dremel 300

series for almost 15 years and never had an issue. Then today when I went to use it today it just wouldn't turn on. <http://srub-servis.ru/userfiles/file/counteract-console-user-manual.xml>

I followed your steps, in addition to using compressed air to blow out all the accumulated dust from inside the tool, and now it's working great. No noises or smell. It jumped and stopped. Now it will not turn back on. If the tool spins freely, the cord, the switch or the brushes could all be at fault. 0 thegrimbarian I will try what you suggest. I did take one brush out and it came out freely; but as I didn't really know what I was doing I put it straight back in and didn't take the other one out. I will try that tomorrow. I tried taking the casing apart by taking the screws out. I thought the hanger was still holding it together but wasn't shore so I put the screws back in in case I made things worse. 0 aceE5 Question What does this mean. Model 200 0 MattP167 I've switched, worked for a few seconds and stopped. Checked the fuse, the brushes, are fine. Opened and checked for current continuity, I have current going though, from the circuit board to the variable switch and also I get current from the two of the four probes going through to the element. What do you think the problem might be. How do I check the element if it works and how do I troubleshoot any further problem areas. I hope I am making my self clear, though my knowledge of electrical and electronics is very basic. But sometimes when taking your dremel apart. You may misalign the plastic piece in which the motor itself seats into. You will at least on the 3000 model see 4 small prongs make sure those are in the correct position. I don't know all the technical terms. But if your wires aren't the problem the prongs not meeting the electrical source is probably the culprit. Mine was also touchy when I came to the graphite brushes 0 Calgary84 I believe the culprit to be the connecting wires white and black, but despite numerous configurations I cannot get the damn thing to turn on. But sometimes when taking your dremel apart. You may misalign the plastic piece in which the motor itself seats into.

You will at least on the 3000 model see 4 small prongs make sure those are in the correct position. I don't know all the technical terms. But if your wires aren't the problem the prongs not meeting the electrical source is probably the culprit. You should have a path on each side one white and one black. If not check the switch is in the fully on position. I hope that this helps and sorry for the late reply. 0 Theo kane You can check the rotating part but will need a multimeter to do so. The copper pads where the brushes contact the rotor should have a direct path to one another on opposite sides. I hope that this helps and sorry for the extremely late reply. 0 Theo kane How do I check if it is the outer core of the motor, or the inner core of the rotating part of the motor that is faulty. Thanks for any replay gents Theo 0 cowboyathome I have to clean mine a lot because I use it to carve wood and it gets a lot of dust in it. More Comments Post Comment Categories Circuits.
